

Weekly Prompt Log

Week: September 14-20, 2026 Reading order: Newest at the top; earliest at the bottom Template: Date/time → subject → prompt → response

Timing note: The referenced Codex task includes an exact timestamp. The pasted transcript did not preserve individual timestamps; contextual references place those entries on September 15, 2026, so they are kept in their original sequence and labeled "time not recorded."

September 18, 2026 - Time not recorded

Subject: Write a simple README for the Sports Chat page

Prompt

Populate my README file in a simple, easy tone that explains the page. Use this JavaScript content to help draft the response:

```
const feedbackForm = document.querySelector("#feedback-form");
const feedbackInput = document.querySelector("#feedback");
const characterCount = document.querySelector("#character-count");
const feedbackStatus = document.querySelector("#feedback-status");

if (feedbackForm && feedbackInput && characterCount && feedbackStatus) {
  function updateCharacterCount() {
    characterCount.textContent = `${feedbackInput.value.length} / 500`;
  }

  feedbackInput.addEventListener("input", () => {
    updateCharacterCount();
    feedbackStatus.textContent = "";
  });

  feedbackForm.addEventListener("submit", (event) => {
    event.preventDefault();

    const feedback = feedbackInput.value.trim();

    if (!feedback) {
      feedbackStatus.textContent = "Add a comment first.";
      feedbackInput.focus();
      return;
    }

    feedbackStatus.textContent = "Thanks - your feedback was received.";

    feedbackForm.reset();
    updateCharacterCount();
  });

  updateCharacterCount();
}
```

Response

I'll check the current README and the page markup so the new explanation matches the actual interface. Then I'll update only the README and verify the result.

The page is a single-page Sports Chat concept: it introduces the idea, shows an early mockup, and includes a feedback form. I'm going to replace the placeholder README with a short overview, usage notes, and a plain-language description of the character counter and submit behavior.

The README now matches the page's actual content and JavaScript behavior. I'm doing a quick whitespace check and reviewing the final changes to make sure the documentation update is clean and limited to the requested file.

Updated `README.md` with a simple explanation of:

- The page's purpose and sections
- The feedback form's behavior
- The role of each project file
- The fact that feedback is not saved or sent to a server

The final formatting check passed successfully, and only the requested README file was changed.

September 18, 2026 - Time not recorded

Subject: Build a three-file “Game Sense” sports-chat webpage

Prompt

I want the headline to read: “Do you want to know why coach ran that play?” I want the JPEG to be in the first section, and I want the text “Who hasn’t been this shocked before?” attached to the image when the mouse hovers over it.

For the second section, summarize and correct the grammar and syntax of this message:

My friend Tobias and I are regular guys who love sports. We talk about it like we get paid for it - but we don't. Eventually, we plan to create an AI chatbot that takes in our questions and kicks out regular-guy-and-girl expressions. We would like to make it available to anyone willing to visit the webpage and try it out. Our personal goal is to use it while streaming: regular guys talking sports with AI.

For the last section, I want the sports-chat mockup to be there. At the bottom of the section, I want a text box with a submit button so feedback can be accepted.

I want three separate files: HTML to cover all the images and text, a separate CSS file, and a separate JavaScript file that contains my text-box comment behavior.

Response

I'll inspect the attached mockup, then build the three-file page and package it with the provided image and PDF reference.

The PDF renderer isn't installed in this workspace, so I'm switching to the available runtime path rather than guessing at the mockup. I'll still keep the page self-contained and use the original PDF as the displayed reference asset.

The mockup is a two-page, clean “Game Sense” chat concept, so I'm matching its restrained card layout while giving your page a stronger fan-first sports identity. The second section will use a polished, corrected version of your message, and the final section will embed the supplied PDF with working feedback behavior.

The page is built and the JavaScript passes a syntax check. I'm packaging the three separate source files alongside both supplied assets so the PDF preview and hover image work immediately when the folder is opened.

The new Drive link resolves to the same image currently used in section one, but the source file is HEIF data mislabeled as `.jpg`. I'm fixing that by converting the first-section asset into a real JPEG so it renders reliably in browsers.

The first-section image is now a valid JPEG, and the complete bundle has been rebuilt with it.

Delivered items

- Sports Chat bundle with the updated first image
- Updated first-section image: `spem.jpg`

The first section now uses the image from the new Drive link. It was visually the same image as before, but the source was HEIF data mislabeled as .jpg, so it was converted to a browser-ready JPEG for reliable display. The updated full bundle was also delivered.

September 18, 2026 - 1:38 AM PT

Subject: Compile this week's prompt log

Prompt

Organize the pasted prompt file and the referenced "Summarize NFL analytics page goal" task into this week's prompt log, using a vertical, consistent template with current entries at the top and the initial entries at the bottom.

Response

The supplied transcript and referenced Codex task were consolidated into this weekly, newest-first prompt log. Prompt/response wording was retained wherever available; one missing prompt and one reconstructed error explanation are explicitly identified.

September 16, 2026 - 8:44 PM PT

Subject: Summarize NFL analytics webpage goal

Prompt

Give me a summary of my goal in one sentence stating who it is for, what the three sections are, and what will be the hardest constraint.

Response

Your goal is to create a single-page introduction for everyday NFL fans and analytics enthusiasts, covering what you and your friend are building, your shared history and purpose, and the platform's future capabilities - with the hardest constraint being making advanced analytics accessible and entertaining without sacrificing credibility.

September 15, 2026 - Time not recorded

Subject: Palindrome numeric-input error

Prompt

```
function isPalindrome(word) { // Convert the word to lowercase const lowerWord = word.toLowerCase(); // Reverse the word
const reversedWord = lowerWord.split("").reverse().join(""); // Compare the original word with the reversed word return
lowerWord === reversedWord; }

// 5 test cases console.log(isPalindrome("racecar")); // true console.log(isPalindrome("hello")); // false
console.log(isPalindrome("level")); // true console.log(isPalindrome("Madam")); // true console.log(isPalindrome("JavaScript"));
// false
```

Will this program crash as soon as the first function lowers the word and I place the number 121 as input?

Response

Yes. With `console.log(isPalindrome(121));`, the original version attempts `word.toLowerCase()` on a number and throws:

```
TypeError: word.toLowerCase is not a function
```

The corrected version converts the input to a string first:

```
function isPalindrome(word) {
  // Convert the input into a string and make it lowercase
  const lowerWord = String(word).toLowerCase();

  // Reverse it
  const reversedWord = lowerWord.split("").reverse().join("");

  // Compare the two
  return lowerWord === reversedWord;
}

console.log(isPalindrome("racecar")); // true
console.log(isPalindrome("hello"));  // false
console.log(isPalindrome(121));      // true
console.log(isPalindrome(123));      // false
console.log(isPalindrome("Madam"));  // true
```

September 15, 2026 - Time not recorded

Subject: JavaScript grocery-list program

Prompt

Write a JavaScript program with a list of 5 grocery items and prices, print each one, then print the total. Comment each section.

Response

```
// SECTION 1: Create a list of 5 grocery items and their prices

const groceries = [
  { item: "Milk", price: 4.50 },
  { item: "Bread", price: 3.25 },
  { item: "Eggs", price: 5.00 },
  { item: "Apples", price: 4.75 },
  { item: "Chicken", price: 8.50 }
];

// SECTION 2: Create a variable to keep track of the total
let total = 0;

// SECTION 3: Go through the grocery list and print each item
for (let grocery of groceries) {
  console.log(grocery.item + ": $" + grocery.price.toFixed(2));

  // Add the item's price to the total
  total = total + grocery.price;
}
```

```
}  
  
// SECTION 4: Print the final total  
  
console.log("Total: $" + total.toFixed(2))
```

September 15, 2026 - Time not recorded

Subject: JavaScript palindrome function

Prompt

Write a JavaScript function that checks if a word is a palindrome, with 5 test cases.

Response

```
function isPalindrome(word) {  
  
  // Convert the word to lowercase  
  const lowerWord = word.toLowerCase();  
  
  // Reverse the word  
  const reversedWord = lowerWord.split("").reverse().join("");  
  
  // Compare the original word with the reversed word  
  return lowerWord === reversedWord;  
}  
  
// 5 test cases  
  
console.log(isPalindrome("racecar")); // true  
  
console.log(isPalindrome("hello")); // false  
  
console.log(isPalindrome("level")); // true  
  
console.log(isPalindrome("Madam")); // true  
  
console.log(isPalindrome("JavaScript")); // false; Here's a simple JavaScript version. A palindrome is a word that reads the  
same forward and backward, like racecar.  
  
function isPalindrome(word) {  
  // Convert the word to lowercase  
  const lowerWord = word.toLowerCase();  
  
  // Reverse the word  
  const reversedWord = lowerWord.split("").reverse().join("");  
  
  // Compare the original word with the reversed word  
  return lowerWord === reversedWord;  
}  
  
// 5 test cases  
console.log(isPalindrome("racecar")); // true  
console.log(isPalindrome("hello")); // false  
console.log(isPalindrome("level")); // true  
console.log(isPalindrome("Madam")); // true  
console.log(isPalindrome("JavaScript")); // false
```

How it works

For "racecar":

Original: racecar → Reversed: racecar → Result: true

For "hello":

Original: hello → Reversed: olleh → Result: false

The `.toLowerCase()` also means "Madam" works even though it contains a capital M.

September 15, 2026 - Time not recorded

Subject: House-training advice

Prompt

write a 3-sentence tip for first-time dog owner about house-training a puppy, in a warm, encouraging tone.

Response

Take your puppy outside frequently - especially after waking, eating, drinking, or playing - and warmly praise them when they go potty in the right place. Accidents are completely normal while they're learning, so clean them up calmly rather than scolding your puppy. Stay patient and consistent with your routine; with plenty of praise and repetition, your puppy will gradually understand exactly what you want.

September 15, 2026 - Time not recorded

Subject: Dogs overview

Prompt

write about dogs

Response

Dogs are among the most popular companion animals in the world. Descended from wolves, they have lived alongside humans for thousands of years and have been selectively bred for qualities such as companionship, hunting, protection, herding, and retrieving.

Dogs vary enormously in size, appearance, temperament, and abilities. A Chihuahua may weigh only a few pounds, while breeds such as Great Danes can weigh well over 100 pounds. Some breeds were developed for specialized jobs: Border Collies for herding livestock, Labrador Retrievers for retrieving, and German Shepherds for working and protection roles.

One reason dogs form strong relationships with people is their ability to communicate socially. They learn routines, recognize voices and gestures, and use body language - including their ears, tails, posture, and facial expressions - to communicate. Dogs also possess an extraordinary sense of smell, allowing specially trained dogs to perform jobs such as search and rescue and detecting certain substances.

Owning a dog also comes with responsibility. Dogs need appropriate food, exercise, veterinary care, training, mental stimulation, and social interaction. Their individual needs vary considerably by breed, age, health, and personality. With proper care, dogs can become deeply integrated members of a household and provide companionship for many years.

September 15, 2026 - Time not recorded

Subject: Local temperature with confidence requirement

Prompt

where is the current temperature where i live? Answer only if you're confident. If you're not sure or can't know this, say so plainly and tell me why.

Response

I'm confident your current area is Santa Clara, California. At about 3:34 PM, the current weather reading is approximately 77°F (25°C) and sunny.

September 15, 2026 - Time not recorded

Subject: Last night's NFL result

Prompt

who won the game last night?

Response

If you mean last night's NFL game, the Kansas City Chiefs beat the Denver Broncos 31-10 on Monday Night Football. [ESPN](#)

Kenneth Walker III was the standout: 173 rushing yards and two touchdowns in his Chiefs debut. Kansas City outgained Denver 392-176, while Patrick Mahomes threw for 184 yards and two touchdowns. [secure-www.cbssports.com](#)

I can also run this game through the traditional + advanced analytics framework we created and show exactly why Kansas City won.

September 15, 2026 - Time not recorded

Subject: Ocean haiku

Prompt

write a haiku about the ocean

Response

Waves whisper to shore
Moonlight dances on the blue
Deep secrets below

September 15, 2026 - Time not recorded

Subject: Local temperature

Prompt

where is the current temperature where i live?

Response

In your area, Santa Clara, California, it's currently about 77°F (25°C) and sunny. Today's high is around 80°F, with a low near 57°F tonight. [National Weather Service](#)

September 15, 2026 - Time not recorded

Subject: Capital of Australia

Prompt

what is the capital of australia

Response

The capital of Australia is Canberra. ☐☐

September 15, 2026 - Time not recorded

Subject: Floccinaucinihilipilification letter count

Prompt

[The original prompt was not included in the pasted transcript.]

Response

The word floccinaucinihilipilification has 29 letters.

September 15, 2026 - Time not recorded

Subject: Compound interest explanation

Prompt

explain compound interest like i'm 15

Response

Think of compound interest as money earning money - and then that new money starts earning money too.

Suppose you have \$1,000 and it earns 10% per year.

After the first year, you earn \$100, so you have \$1,100. In the second year, you don't earn 10% on just your original \$1,000. You earn 10% on the entire \$1,100, giving you \$1,210. In year three, you earn interest on \$1,210, giving you \$1,331.

Year	Starting amount	10% earned	Ending amount
0	\$1,000	-	\$1,000
1	\$1,000	\$100	\$1,100
2	\$1,100	\$110	\$1,210
3	\$1,210	\$121	\$1,331
10	-	-	≈ \$2,594
20	-	-	≈ \$6,727

Notice what's happening: you aren't adding the same \$100 every year. The amount you earn keeps getting larger because your previous interest is now earning interest.

The basic formula looks like this:

$$FV = PV(1+r)^n$$
$$FV = PV(1+r)^n = 1000(1+0.1)^{20} = \text{\$6,727.50}$$
$$\text{\$}$$
$$\%$$

Here, PV is the money you start with, r is your interest rate, n is the number of periods your money grows, and FV is how much you end up with.

A good way to remember it is:

Simple interest: Your money earns money. Compound interest: Your money earns money, and the money it earns also earns money.

That's why time is incredibly important with compound interest. The longer you leave money invested, the more opportunity the compounding effect has to accelerate.

September 15, 2026 - Time not recorded

Subject: Detroit Lions vs. Buffalo Bills analysis

Prompt

Detroit Lions vs Buffalo Bills - september 17, 2026

Response

Detroit Lions at Buffalo Bills - September 17, 2026

I weighted 2024 at 30%, 2025 at 45%, and 2026 Week 1 at 25%, then adjusted the matchup layer for roster/coaching continuity, current injuries, opponent interaction, home field, and the Thursday short week. The biggest historical separator is consistency: Detroit went 15-2 in 2024 but 9-8 in 2025, while Buffalo went 13-4 and 12-5. Both are 1-0 now. Buffalo's 2025 offense also held the stronger advanced profile, while Detroit's 2026 opener showed a potentially important resurgence in the run game. [Pro Football Reference](#)

Traditional analytics

Measurement	Detroit	Buffalo	Matchup interpretation
2024 record	15-2	13-4	DET
2024 points/game	33.2	30.9	DET
2024 points allowed/game	20.1	21.6	DET
2025 record	9-8	12-5	BUF
2025 points/game	28.3	28.3	Even
2025 points allowed/game	24.3	21.5	BUF

Measurement	Detroit	Buffalo	Matchup interpretation
2025 yards/play	6.0	5.9	Slight DET
2025 rushing yards	2,041	2,714	BUF
2026 Week 1 score	31-30 NO	36-31 HOU	Slight BUF
Week 1 total offense	369	409	BUF
Week 1 rushing	165	86	DET
Week 1 pass yards	204	323	BUF
Week 1 yards allowed	469	381	BUF
Week 1 turnovers forced	3	2	DET

Detroit's Week 1 defense is the largest warning in the traditional numbers: New Orleans generated 469 total yards, including 378 net passing yards, while Buffalo immediately produced 409 yards against Houston. Detroit's counter is its running game - Jahmyr Gibbs ran for 156 yards, and Detroit posted a 51.5% rushing success rate. [Pro Football Reference](#)

Advanced analytics

Measurement	Detroit	Buffalo	Advantage
2024 offensive EPA/play	+0.15	+0.15	Even
2024 offensive success rate	50.0%	46.6%	DET
2025 offensive EPA/play	\~+0.08	\~+0.14	BUF
2025 defensive EPA/play	\~-0.01	\~-0.02	Slight BUF
2025 Buffalo defensive run weakness	-	30th in EPA/rush allowed	DET run-game opportunity
DET Week 1 rushing success	51.5%	-	DET
Week 1 offensive expected-points contribution	+5.23	+15.78	BUF
Week 1 defensive expected-points contribution	-7.05	-10.75	DET, but both negative

The longer-term advanced data point toward Buffalo offensively: one 2025 play-by-play source has Buffalo at about +0.14 offensive EPA/play versus Detroit +0.08, while SumerSports similarly ranks Buffalo's 2025 offense ahead. Detroit's strongest counter is matchup-specific: Buffalo's 2025 defense ranked 30th against the run by EPA/rush allowed, exactly where Detroit's Gibbs-centered Week 1 offense looked strongest. [SumerSports](#)

Roster, coaching and injury adjustments

Factor	Detroit	Buffalo	Edge
Head coach continuity	Dan Campbell retained	Joe Brady promoted to HC	DET slight
Offensive system	New OC Drew Petzing	Brady system largely retained; Pete Carmichael OC	BUF
Major offensive change	David Montgomery gone; Gibbs larger role	DJ Moore added to Allen's weapons	BUF
Defensive additions/front	Improved-looking DL/pass rush	Bradley Chubb among additions	Even
Current OL health	Mahogany/Miller concerns; Scruggs limited	Comparatively healthier	BUF significant

Factor	Detroit	Buffalo	Edge
Secondary health/performance	Major Week 1 concern	Also imperfect, but better Week 1 result	BUF
Home environment	Road	New Highmark Stadium home opener	BUF

Detroit's offensive-line situation matters because Christian Mahogany and Blake Miller have missed practice work ahead of the short-week game, while Buffalo's significant injury situation appears more manageable. Detroit changed offensive coordinators to Drew Petzing for 2026; Buffalo promoted Joe Brady to head coach, with Pete Carmichael coordinating an offense whose underlying structure remains connected to Brady. [Pride Of Detroit](#)

Betting market - September 15

Sportsbook/source	Detroit spread	Buffalo spread	DET ML	BUF ML	Total
DraftKings	+4.5	-4.5	+170	-205	53.5
FanDuel	+4.5	-4.5	+180	-215	53.5
bet365	+4.5	-4.5	+185	-225	53.5
OddsChecker market	+4.5	-4.5	+188	-218	53.5

The important market information isn't merely Buffalo -4.5: the matchup opened around Buffalo -3 and has moved to -4.5, while the total moved from roughly 52.5 to 53.5. DraftKings' -205/+170 moneyline corresponds to approximately 64.5% Buffalo / 35.5% Detroit after removing the bookmaker margin. Other books are in roughly the same neighborhood. [Action Network](#)

My matchup advantage index

Lions vs Bills matchup advantage

Model-derived relative matchup index using 2024-25 history, 2026 Week 1, roster/coaching changes, injuries and matchup interactions.

Detroit

Buffalo

0%25%50%75%100%QB / passing offenseRunning-gamematchupPass defensePass rushOL / pass protectionTurnover profileCoaching / schemeRoster / injuriesHome / short weekOverall analytics i...

These are comparative strength scores, not win probabilities or betting recommendations.

Bottom line: my analytics index is Buffalo 56% / Detroit 44%, compared with the betting market's roughly 65% / 35% moneyline implication. Buffalo's clearest advantages are Josh Allen and the passing game, Detroit's vulnerable secondary, home field, and Detroit's offensive-line injuries; Detroit's clearest path to reversing those advantages is Gibbs and the running game against Buffalo's historically vulnerable run defense, paired with Hutchinson and the pass rush disrupting Allen. The interesting discrepancy is that my football-performance comparison is less Buffalo-heavy than the current betting market, even though both point to the same underlying matchup advantages. [thescore.com](#)

September 15, 2026 - Time not recorded

Subject: NFL matchup analytics framework

Prompt

give me a chart that includes traditional analytics and advanced analytics that the nfl uses to access what contribute to winning performances. when i input teams and date of match, i want you to search the internet and get all betting information and i want you to compare that information with the measurments that comes from both analytics. when you search for data on the teams, i need you to take into consideration of history dating from the last two seasons as well as the first game of the season. I need the consideration to include rosterchanges and coaching changes as well. then output your findings in comparison form using percentane to mark advantages in the matchup.

Response

Yes. I'll use the following framework whenever you give me two NFL teams + the game date. I'll keep traditional and advanced analytics separate, then combine them with current betting-market information and roster/coaching context to produce percentage matchup advantages.

Traditional NFL analytics

Area	Metric	What it helps measure
Quarterback	Completion %, passing yards, TD/INT, passer rating	Production and ball security
Rushing	Rush yards, yards/carry, rushing TDs	Ground-game productivity
Receiving	Receptions, receiving yards, yards/reception, TDs	Passing-game production
Offense	Points/game	Scoring output
Offense	Total yards/game	Overall production
Offense	Third-down conversion %	Drive sustainability
Offense	Red-zone TD %	Scoring efficiency
Defense	Points allowed/game	Overall defensive results
Defense	Yards allowed/game	Yardage suppression
Defense	Rush/pass yards allowed	Positional defensive strength
Defense	Sacks	Pass-rush production
Defense	Interceptions/fumbles	Turnover creation
Team	Turnover differential	Possession advantage
Team	Penalties/penalty yards	Discipline
Special teams	FG %, punt/kick return averages	Field-position/scoring impact

Advanced NFL analytics

Area	Metric	What it helps measure
Overall efficiency	EPA/play	Value added or lost on every play
Passing	EPA/dropback	QB/pass-game efficiency
Rushing	EPA/rush	Running efficiency
Consistency	Success Rate	Frequency of positive-value plays
Quarterback	CPOE	Accuracy versus expected completion rate
Quarterback	Pressure-to-sack rate	Ability to avoid sacks under pressure
Passing	Air yards / intended air yards	Passing aggressiveness
Passing	Explosive pass rate	Big-play ability

Area	Metric	What it helps measure
Rushing	Yards after contact	Runner-created production
Blocking	Pressure rate allowed	Pass-protection quality
Defense	Defensive EPA/play	Overall defensive efficiency
Defense	EPA/dropback allowed	Pass-defense effectiveness
Defense	EPA/rush allowed	Run-defense effectiveness
Defense	Pressure rate	Ability to disrupt quarterbacks
Defense	Explosive-play rate allowed	Big-play prevention
Situational	Early-down EPA	Ability to avoid obvious passing situations
Situational	Third/fourth-down EPA	High-leverage performance
Field position	Starting field position	Hidden possession value
Win contribution	Win Probability Added	Effect of plays on game-winning probability

When you give me a matchup, I'll examine the previous two full seasons plus every available game from the current season. Recent games will receive more weight than older games rather than treating all three periods equally. I'll specifically check quarterback changes, free-agent acquisitions and losses, draft additions, offensive-line changes, major injuries, coordinator changes, head-coaching changes, scheme changes, snap counts and role changes.

I'll also search current betting information for the specific game, including point spread, moneyline, over/under, opening versus current lines, implied win probabilities, line movement, sportsbook differences, and available betting/public-money information. I'll separate what the betting market is implying from what the football analytics indicate, so you can see where they agree or disagree.

For the final comparison, I'll convert each category into a relative matchup advantage rather than simply declaring one team better. A finished result will look approximately like this:

Matchup category	Team A	Team B	Advantage
QB efficiency	56%	44%	Team A +12%
Passing offense vs pass defense	53%	47%	Team A +6%
Rushing matchup	46%	54%	Team B +8%
Offensive line/pass protection	51%	49%	Team A +2%
Defensive efficiency	45%	55%	Team B +10%
Explosive plays	57%	43%	Team A +14%
Third/red-zone efficiency	52%	48%	Team A +4%
Turnover profile	49%	51%	Team B +2%
Special teams	48%	52%	Team B +4%
Coaching/scheme	50%	50%	Even
Injury/roster situation	54%	46%	Team A +8%
Overall analytics profile	53%	47%	Team A +6%

Those percentages will be derived matchup-strength scores, not claimed probabilities of winning. I'll show the betting market's implied probability separately so we can compare analytics vs. market expectation without confusing the two.

Send your matchup in this format:

and I'll run the full analysis using current web data.

September 15, 2026 - Time not recorded

Subject: NFL analytics overview

Prompt

write about nfl analytics

Response

NFL Analytics

NFL analytics is the use of statistics and data to evaluate how players and teams perform and how much their performance contributes to winning. Traditional football statistics remain useful, but advanced analytics add context by measuring efficiency, situation, opponent strength, and the value created on each play.

Traditional analytics include familiar statistics such as passing yards, touchdowns, interceptions, completion percentage, rushing yards, yards per carry, receptions, sacks, tackles, turnovers, points scored, and points allowed. These statistics describe what happened, but they can sometimes be misleading. For example, a quarterback can accumulate 350 passing yards while trailing by several touchdowns, even though those yards may have had relatively little effect on the game's outcome.

Advanced analytics attempt to measure performance more precisely. EPA (Expected Points Added) estimates how much a play increases or decreases a team's expected points. EPA per play is particularly useful for measuring offensive and defensive efficiency. Success Rate measures how consistently plays improve a team's situation rather than relying on occasional explosive plays. CPOE (Completion Percentage Over Expected) evaluates quarterback accuracy relative to the difficulty of attempted passes. Other useful measures include pressure rate, sack rate, explosive-play rate, yards after contact, yards after catch, red-zone efficiency, third-down efficiency, and turnover-worthy play rate.

The strongest NFL analysis combines both approaches. Traditional statistics tell us what a player or team produced, while advanced statistics help explain how efficiently and meaningfully that production occurred. When comparing two teams, separating offense and defense and examining efficiency, consistency, explosiveness, turnovers, quarterback play, pass protection, and situational performance can provide a much stronger picture than simply comparing wins, points, or total yards.

September 15, 2026 - Time not recorded

Subject: Prompt-log organization preference

Prompt

Keep accurate track of all prompts and responses, organized by date and subject for later file searches.

Response

I'll use date + subject as the organizational convention for prompts and responses intended for later retrieval, for example:

2026-09-15 - JavaScript Palindrome Function

This preference can guide how I name and organize future prompt/response artifacts.
